

**ARTISTIC RESEARCH DOCUMENT  
MASTER OF ART IN SCENOGRAPHY HKU  
2014-2016**

**YI-LING HUNG**

This is a printed version of my research. You will read my research document in a structural order, which I have to admit, cannot truly present what I have experienced and thought during the two-year research. I sincerely invite you to visit my research document website: **yilinghung.com**, it will show you the document in a non-linear way, yet a more complex intertwined network which represents the way our brain works.

**PREFACE**

## **PREFACE**

When I was thinking about the final format for this thesis research, the first thought that came to my mind was questioning the necessity of making a book. Conventionally, books regulate the sequence of the content: either chronologically or according to its developing process. I want to offer the readers the freedom to read my research in the order they prefer. Can it be a box then? Literally, a box, which is filled with different elements, such as pictures, notes, drawings or models? The readers can then take out those elements and examine them based on their preference. After discussing this idea with my program mentor Henny Dorr, she encouraged me to think of more possibilities for the format and also she shared her idea about it: presenting the research in a way that is easily shared and that facilitates conversations or discussions with other people. So perhaps a video, an animation or a website? Through sharing with Henny I was inspired: a document in hyperlinks. What I find interesting about hyperlinks is that the person who makes this has the initial power for deciding which element (a word, an image or a quote etc.) connect to which other element, yet simultaneously, the writer also allows the reader multiple ways to read the document that they can read the research and the parts of the research in different orders. As an artist and the writer of this artistic research, I see many linkages among my works and other materials. For example, I was inspired by performance A and by article B, I aroused a question, so I made project C to try to find the answer; and further, because of project C, and read article D, visited exhibition E, and I wanted to see performance A again.

You might feel like losing your way through all the links as you read this document, yet rest assured: it's also part of the journey. After all, everything is related to everything.

## INTRODUCTION 1.

### Life is Like a Series of Performances 1.1

My bachelor final project in architecture study was: Drama: Solos --- everyone plays their own role to make life become a whole, I gave it such a title to reflect my personal observation on the subject of life: we are part of a social network and we play different roles across social contexts . These social contexts are often regulated by a set of norms; such as:

I am a student, I have to do homework, attend classes and participate exams, etc..

I am a waitress, I have to serve food, clean tables and be hospitable, etc...

I am a cat-owner, I have to ...

I am a sister, ...

I am a ...

You are a student, you have to do homework, attend classes and participate exams, etc..

We are classmates.

You are a cook, you have to prepare food, order ingredients and tidy the kitchen, etc..

We are colleagues.

You are a veterinarian, you have to ...

We are ...

You are a sister, ...

We are ...

You are a ...

We ...

We live in a way according to what roles we are playing, but this is not our life yet, what makes life becomes alive and continually moving on, are the interactions which created among us.

"Since human life represents a basic and essential object of architecture, (Milićević), structure and final form of architecture need to be concerned as a machine (Le Corbusier), not as a scene, sculpture or designed artefact." [1] A quote from Radivoje Dinulović, Professor of Faculty of Technical Sciences, University of Novi Sad, Serbia, says that since architecture is connected to human life, it should have the ability to move/operate, rather than being a static object. Because we are alive, we have to keep moving and being moved thus relations are generated. But the involved "roles" are not only performed by human-beings, also objects. Let me try to explain this by describing a situation: it is raining suddenly while I am on the way to school, and you are on your way to work. Because of the heavy rain, we shelter under a shed in front of a shop (maybe a supermarket?), and then we start a conversation. We have never planned to encounter this rain or to stop in front of the shop, before the rain we were two strangers to each other yet now we are acquainted.

Life is a big performance, composed by a series of performances. Our surrounding is the stage. There are so many performers involved in it and the story is being written along the way. A social theory, the Actor-Network Theory (ANT), was developed by Bruno Latour and his colleagues in the early 1980s [R.1]. It says that all objects, including human-beings, are part of social networks, meaning that when any one of them moves or changes, it will influence all the other parts. A social system is like a big machine which operates/performs by all parts (all the objects) that perform their functions. One of my favorite films, *The Adjustment Bureau* (Fig.1), also talks about this concept when dealing with relations in life. A bureau who holds a book that illustrate everyone's life plan, i.e. your past, present and future are all drawn in the book. Moreover this book shows who you will encounter throughout your life's journey. What fascinates me in this movie is not the "super power" that plans everyone's life paths, but the consequences for leaving your "planned path", leading to unplanned changes that influence all the other components and their paths in this big mechanical system---life.

Fig.1. Image from the movie "The Adjustment Bureau" (2011).  
The Life Plan Book. <http://www.artofvfx.com/the-adjustment-bureau-mark-russell-superviseur-vfx-de-la-production-2/>

Jon Mckenzie in his book *Perform or Else*, writes, "what struck me then still resonates today: "performance" can be read as both experimentation and normativity." [2] For Mckenzie he found the two separated definition towards performance, but for me his discovery is an entrance that allows me to move from a social observation to a theatrical research, or at least it helps me to find a connection between the two.

The French curator Nicolas Bourriaud, in his book *Relational Aesthetics*, writes: "The role of artworks is no longer to form imaginary and utopian realities, but to actually be ways of living and models of action within the existing real." [3] In my research, rather than trying to discuss social networks system, I address issues involved with the discussion, analysis and practice in performative art works. Based on Latour's concept, I believe this research still reflects on our daily life.

## **INTRODUCTION 1.**

### The Awareness on Time and Relations 1.2

In January 2013, one of my closest friends passed away in a traffic accident. We had known each other since we were in high school. I always remember that the two months prior to the accident, together with some of our other common friends, we were celebrating my birthday. She told me she was going to quit her job, and then planning to find a job in the graphic design industry, something that had always been her dream. But in the end, the accident happened and so she did not have time to realise that dream.

The year 2013 was a year that I will never forget for the rest of my life. Many people that I know, passed away due to all sorts of reasons. A friend, colleague, teacher, aunt, grand-grandmother and my older sister. These events were physically and emotionally very hard on me. I have realised how unpredictable our lives are. I start to see these sudden and unprepared for events, like a cup of tea that accidentally falls and then breaks, because the wind blows too strong, blows over the vase on the table causing the fall of the cup? Or like a roll of toilet paper is finished when you need it? Since then, I am becoming more sensitive to all elements related to time in life and more aware of the relations among all objects (belongings, people or phenomena etc..)

## INTRODUCTION 1.

### Three Elements in This Research: Time, Performer and Space 1.3

Time, performer and space are three important and unavoidable elements in performance art. In the book *Postdramatic Theatre*, written by Hans-Thies Lehmann, in the chapter *Performance*, he writes "With reference to the notion and practice of 'Concept Art' (as it flourished especially around 1970), postdramatic theatre can be seen as an attempt to conceptualize art in the sense that it offers not a representation but an intentionally unmediated experience of the real (time, space, body): Concept Theatre." [4] The three are main subjects in this artistic research as well, only I use the term "performer", rather than "actor" in order to elaborate on the discussion between the human performer and the non-human performer.

Because of my architectural background, designing a space to me means creating a space for letting things happen. Radivoje Dinulović in his article *The Ideological Function of Architecture in the Society of Spectacle* wrote "function of instead of function in architecture needs to be observed as a dominant value. Furthermore, the word 'function' should be understood as pluralia tantum, or even material noun. As photography does not reach art through painting but through theatre (Barthes), architecture reaches art through its functions and not through visuality." [5] It doesn't really matter the space is a public square, a private living room or a stage in theatre. Furthermore, in order to start the design, as a spatial designer, I must first know who will be the users, and what event will take place and when. Users, time and event are priority in my designing process, and then the space will be formed according to those elements. Therefore in this research, I do not discuss the space in performance works from the beginning, yet through analyzing the two elements, time and performer in each work, I believe the notion of space across the works is made explicit or at least is sensed from the analysis.

To help myself in analysing my own works and other performative works, I have developed a tool: a quadrant. It is based on the Cartesian coordinate system [R.2], which can specify each point by a numerical pair among the reference axes. My quadrant is a two dimension coordinate system, meaning that it has two reference axes crossing each other, with time at the horizontal axis and performer at the vertical axis. This analytical tool is explained in more detail in chapter 2: *The Quadrant And The Analysis Of Works*.

So what is this research about? What are my hypotheses? There are actually so many things that I want to explore in the field of performative art with the help from the quadrant. As a maker and a researcher, making works helps me to test out some thoughts during researching. Through research I collect ingredients and inspiration to make works. Making and Researching influence each other and generate inputs to keep going further. How can I create a performative experience without a human performer but rather a non-human performer? How can I change the spectators' cognition from the human performer to a non-human performer within the frame of one performative experience, or vice versa? How can I create the transiting point of, again, spectators' cognition of real time into fictive time, or vice versa? What do human performer, non-human performer, real time and fictive time that I actually mean? To sum up, this research is a process of developing the research tool "the quadrant" and trying to find the possibility of it, can it be a tool for analyzing? Can it be a tool for making projects? Can it be a tool for spectators to approach works?

## INTRODUCTION 1.

### Framing: the Keywords 1.4.1

Here I list the important terms in this research and try to give them a clearer framework. They are:

Performance; Time; Performer; Real time; Fictive time; Human Performer; Non-human Performer.

### Performance 1.4.2

A performance is a happening. More precisely, a performance is a happening, and the happening is carried out by performers through actions that can be a movement or any kind of change. To be more precise, a performance is a happening, and the happening is marked by the sequences of changes of relations among performers with their action. The action can be a movement or a change. Also there is temporality in performance that may or may not be related to the content of the happening. The temporality in performance is more like a frame for the spectators. So a performance can be an artistic work that occurs on an arranged stage (Fig.2), yet it can also be a bodily movement happens in life (Fig.3), but it can even be a small and short event happening unexpectedly (Fig.4).

### **Time 1.4.3**

Time is a broad concept and has been discussed in different fields through out the long human history [R.3]. Also the theatre journal: *Theaterschrift* picked time as its topic in one issue, Sabine Pochhammer wrote in the introduction "Nevertheless, we cannot escape from it, for our existence is temporal; it is, according to Heidegger, being toward death." [6] Time is something strongly connected with our daily life, 'we are living in time'.

When we mention time in daily life, e.g. "What time is it?" Normally we refer to seconds, minutes, hours, days, months, or years and so on. Through out the generations, there have been many different ways to define time-units. Because of the new inventions of technology or discovery of new chemical element, our definition for the common unit of time is ever changing. A second is the base unit of time according to the International System of Units(SI), and many other time units, e.g. hours, develop from the duration of a second [R.4]. They have become a norm that regulates our sense of time in our life.

In the old times, many cultures had their own way to measure time and own calendar to record time. In Chinese culture, nowadays we still use many phrases and proverbs which indicate time but contains the sense of time from the past, e.g. by describing the position of the sun or the height of the water-level. Chinese New Year is always celebrated the first day of the year, the same as many other cultures, but the Chinese calendar [R.5] considers this day to be around the beginning of February in the International common calendar. What I try to address here is that time is an abstract concept: it needs a certain frame or certain definition, in order to be discussed, to be aware of or to be used.

If there is no relativity, time has no influence on our perception. "One minute" itself does not give any temporal impression, there is nothing about it that is too short, too long, too fast or too slow. Only if I say, e.g., "I read the whole page in one minute, but you took ten minutes", then a comparison between one and ten minutes is shown. Thus the one minute starts to have the effect on our cognition, "my reading speed is quicker".

In this artistic research, especially on my practical projects, I tried to re-think and give a redefinition of the time-unit. For example, I let spectators experience the relatively of temporality through a sugar-falling installation. The projects will be introduced in the chapter 2.

### **Performer 1.4.4**

I want to first make it clear among three words: performer, actor and character. There have already been numerous research or academic definitions about the following three elements in the theatre field: performer, actor and character. I would like to reflect on what I have read during the research and explain the concept as I interpret them. Through these conceptualizations I hope that you, readers, understand why I choose (or did not choose) to use certain terms:

### **-Actor**

Actors are humans who perform or act under a certain instruction or goal. They may or may not talk, but their act is the main way to convey the story. The quote from *Intermediality in Theatre and Performance*, written by Freda Chapple and Chiel Kattenbelt, " .... This has led to a definition of theatre as a performance space in which unity of time is the principle structuring factor, and the actor is the dominant force, distinguishing himself from the static space in which he is moving." [7]

### **-Character**

The characters are fictional roles in the performance. In *Digital Theatre Words*, [R.6] an on-going project for collecting theatre terminology by OISTAT, a character is a person represented in a drama or story. A character may or may not be carried out by a real human, e.g. a wrapped towel can be an infant in a theatre play.

### **-Performer**

Everything on stage can be a performer. "A thing is performing" means that something's status is changing, (position, colour, shape, or temperature, etc.) and the change should relate to a meaningful reason in the whole performance.

## **Real Time 1.4.5**

In this research, I am not going to discuss the real time in a cultural, social, archeological or anthropological way. Rather, I would like to focus on discussing the temporal perception of the spectators while the happening is happening.

The perceived time equals the experienced time, i.e., there is only one direction and one dimension of time during the performative experience. For example, a performance is about one family that escaped from their home country to another and slowly settled down in the new country. During the three-hour performance, audience see the entire story line of this migrating family. In the best situation, the audience forgets everything in their real life. They may forget they have to work the day after or to hand-in monthly report tonight. What matters to them is the story-line of the performance from the start to the finish.

## **Fictive Time 1.4.6**

I was struggling with these two words: "fictive" and "fictional".

According to the Oxford Dictionary, the word "fictive" refers to something being created by the imagination [R.7], and the word "fictional" means something is invented for the purpose of fiction [R.8].

I replaced the term, fictional time by fictive time at a certain moment, because the idea about the discussion of the temporal statement in this research became gradually clearer. The experience of fictive time during performative experience is that the spectators may recognise multiple layers of time, and perhaps, a bit of confusion or questioning about what temporal statement they are in at that moment. I choose the term "fictive" because what I want to discuss is a cognition or a sense that grows from the inside of our body.

#### Human Performer 1.4.7

In contrast to a non-human performer, a human performer can be seen as an actor. "An actor" is actually still a broad and general term to me. There is a continuum (Fig. 5) about acting which was developed by Michael Kirby. In his article he suggests that there should be different "amounts" of acting in acting. [R.9] He mentioned that the stage crew who prepare the stage or the people who are performers but as passerby, not related to the story directly, are both possible to be placed on his acting/not-acting continuum. I found this article by Kirby after I had developed my research for some time, but I was still very inspired by his structural way to analyse the acting. What about the audience, viewers or spectators? Where shall they be placed in Kirby's model, those whom sometimes involve in a situation that they have double roles: spectators and performers at the same time?

| <b>NOT-ACTING</b>                  |                                        |                              |                          | <b>ACTING</b>             |
|------------------------------------|----------------------------------------|------------------------------|--------------------------|---------------------------|
| <b>Non-Matrixed<br/>Performing</b> | <b>Non-Matrixed<br/>Representation</b> | <b>"Received"<br/>Acting</b> | <b>Simple<br/>Acting</b> | <b>Complex<br/>Acting</b> |

Fig.5. Spectrum of acting, Michael Kirby. "On Acting and Not-acting." The Drama Review: TDR. Published by The MIT Press 1972. vol. 16. p.3-15.

#### Non-human Performer 1.4.8

A non-human performer here refers to anything or I should say, any object, that performs or changes its status (e.g. color, shape, or position, etc.) meaningfully without human's intervention during the performative experience. [Fig.6,7] I use the term "Meaningfully", because the change should relate to the context and leads spectators to get to know more of the whole picture of the performance.

## The Quadrant and the analysis of works 2.

### The Quadrant 2.1

When I was studying in high school, mathematics and geography were my two favorite subjects. I learned the Cartesian coordinate system and used it for the first time in high school. What I find interesting about this system is that when we put dots in it, we see not only the information of each dot, but also the relations among them. (Fig.8,9) A quadrant is a system that is formed from two-dimensional Cartesian system (Fig.10) [R.2].

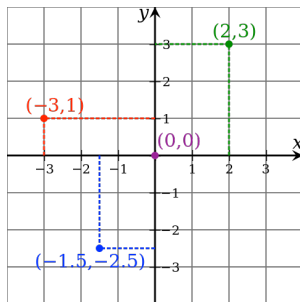

Fig.8. X-Y Cartesian coordinate System. [https://en.wikipedia.org/wiki/Cartesian\\_coordinate\\_system](https://en.wikipedia.org/wiki/Cartesian_coordinate_system)

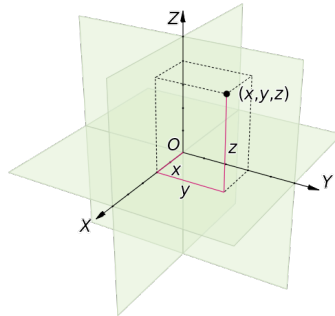

Fig.9. X-Y-Z Cartesian coordinate System. [https://en.wikipedia.org/wiki/Cartesian\\_coordinate\\_system](https://en.wikipedia.org/wiki/Cartesian_coordinate_system)

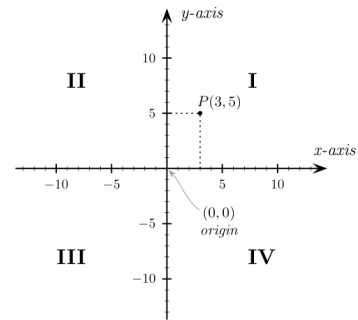

Fig.10. Quadrant. [https://en.wikipedia.org/wiki/Cartesian\\_coordinate\\_system](https://en.wikipedia.org/wiki/Cartesian_coordinate_system)

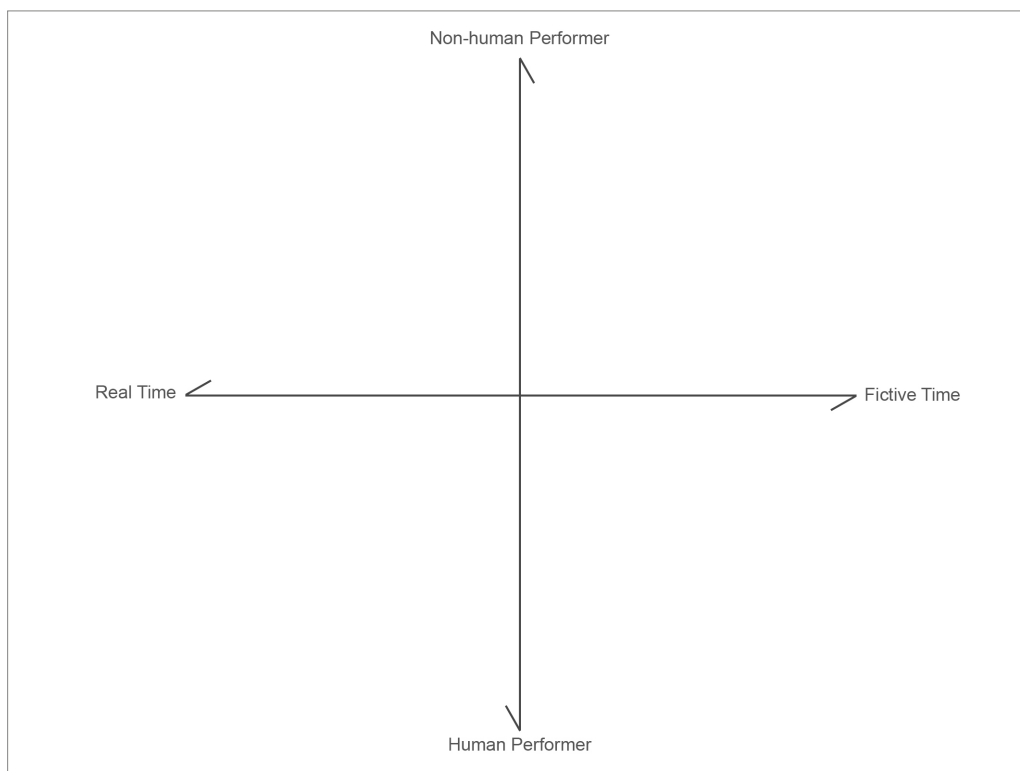

Diagram 1. The Quadrant

## The Quadrant and the analysis of works 2.

### The X-axis 2.2

On the X-axis is Real Time - Fictive Time and on the Y-axis is Human Performer - Non Human Performer. (Diagram 1.) Since time and performer are two crucial elements in performing works, what about Space then? Space is on the Z-axis, for now the space won't be discussed from the beginning, but at the later part of the research. I will start with the two axes of time and performer.

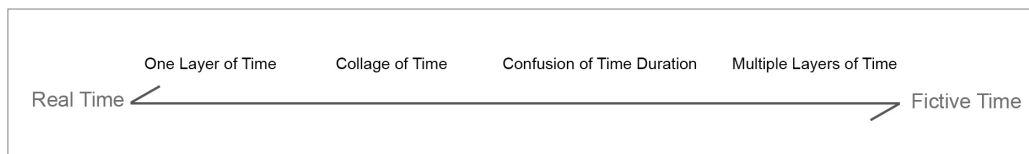

Diagram 2. X-axis: Real Time - Fictive Time

The X-axis is about time: the time that the spectators perceive in the performative works. (Diagram 2.) From the left side of this axis is Real Time and Fictive Time at the right side. There are four transitions on this continuum (a.) one layer of time, (b.) Collage of time, (c.) Confusion of time duration and (d.) multiple layers of time.

#### (a.) One layer of time

There is only one-direction story line in the performance without repeating, overlapping or any form of changing its temporality. The spectators are brought into this story and follow the whole dramaturgy which is created by the theatre group or the artist. For example, You sit in the theatre for 2 hours for a performance, it's a story about a woman's whole life. It is presented in a narrative way, from her birth to her death. This is what I mean about "One layer of time".

#### (b.) Collage of time

When the theatre group or artist presents their work by representing or recomposing the elements which are collected at different periods of time. The essence of time has not been changed, the performance is presented as a collage of time. The work Tagfish [P.5] that I've selected to discuss in this research is a performance that presented by series of interview videos which were taken at different times and different places.

#### (c.) Confusion of time duration

The theatre group or artist tries to twist the audience's sense of duration. Imagine a situation where you are sitting in a black box and there is only one actor on stage. She/he is doing nothing but only walking in circles at the same speed around the stage. Maybe you will feel like it's been half an hour but actually only 5 minutes have passed. The repeating movement makes you feel confused about duration.

(d.) Multiple layers of time

Spectators experience and perceive different layers of time during the performance. In order to achieve this state, there should be one layer of time as a base upon which more are built. The German theatre researcher Hans-Thies Lehmann in his book *Post-dramatic Theatre* writes "The unity creates a continuity that is meant to make invisible any split between fictive time and real time". [1] I quite agree with this quote of Lehmann. Let's take the example I mentioned above, the one where the only actor is walking in circles for the whole performance. Imagine again, if your phone or watch is taken away by a crew before you enter the black box, the only thing you have with you to indicate time is the ticket which writes that the performance will last 2 hours. Ok, you find the seat and the show starts, during the whole performance, you cannot know how much time is still left. You feel like floating in the air, very uncertain about time. Maybe you even feel it's been 4 hours when the show is finished. Until you get your watch back, you realize only 1 hour has passed. I consider that the performance has ended at the moment you look at the clock, not in the theatre hall. Because of the action of looking at the clock, you receive two layers of time, 1 hour in reality but 4 hours in experience.

## The Quadrant and the analysis of works 2.

### The Y-axis 2.3

The Y-axis is about performer: the object(s) that are changing its status in order to tell the story in the work. (Diagram 3.)

At the bottom of this axis is Human Performer and on the top is Non-human Performer. From the bottom towards the top, there are four transitions, (a.) acting according to the script, (b.) moving because of the interaction, (c.) changing passively and (d.) changing the status according to its own rule.

#### (a.) Acting according to the script

The classical way of acting. The performer reads or memorizes the script and presents it in his or her own way.

#### (b.) Moving because of interaction

The performers have certain movement because of an interaction through out the dramaturgic process. A new relation is created among the performers and thus triggers another movement that is not directly generated by the script.

#### (c.) Changing passively

If the (b.) means that the performer takes the initiative action to change something in the performance, then there might be some other elements affected by this changing. For example, I grab a cup, the cup is grabbed by me. Its position is changed from standing on a table to being hold in my hand.

#### (d.) Changing the status according to its own rule

The performer changes according to its own rule. It is difficult to estimate what will be its next step or when it will finish. It has its own rhythm and rule. For example, the day light generates the shadow and moves its own orbit during the day, it is a natural phenomenon, we cannot change anything about it. Another more extreme example, I walk in a busy street, many people pass by me and I cannot control their direction. The only thing I can do is to change my route, in order to avoid being blocked by people. The people here become an element with its own rule.

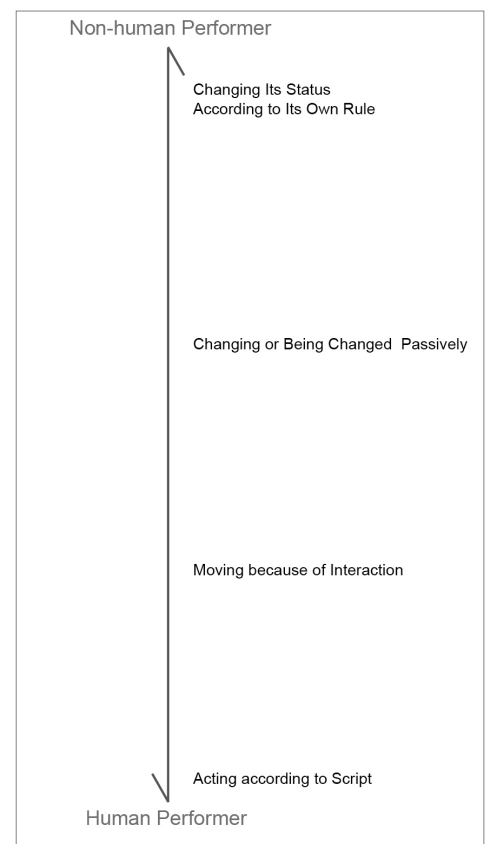

Diagram 3. Y-axis:  
Human Performer - Non-human Performers

## The Quadrant and the analysis of works 2.

### Transitions 2.4

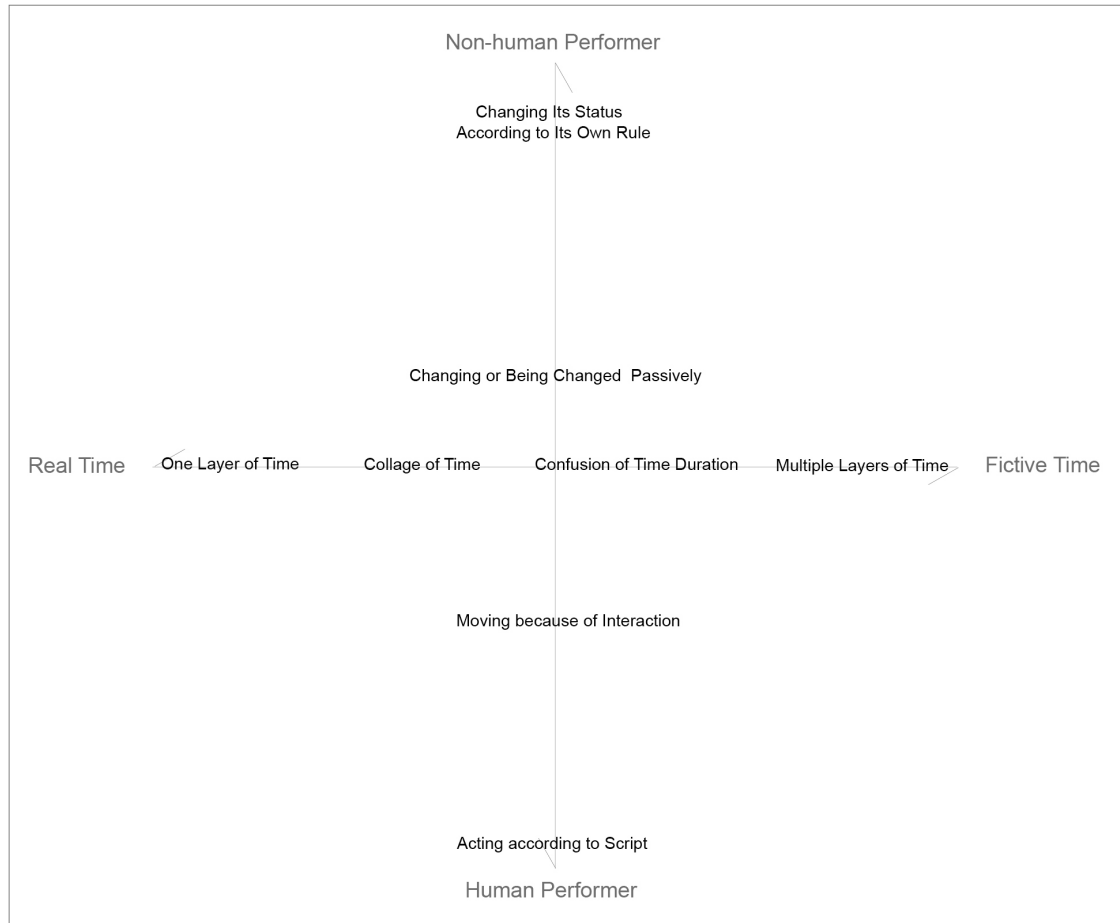

Diagram 4. Transitions in the quadrant

I have selected nine referencing works and eight of my own works for positioning them in the quadrant. The positions of the total 17 points in the quadrant are relative. There will not be any numbers to measure how much of the point of 'collage of time' is present in any work. Thus the positions and in-between distance of the works are more representing their relations among each other. (Diagram 4-6)

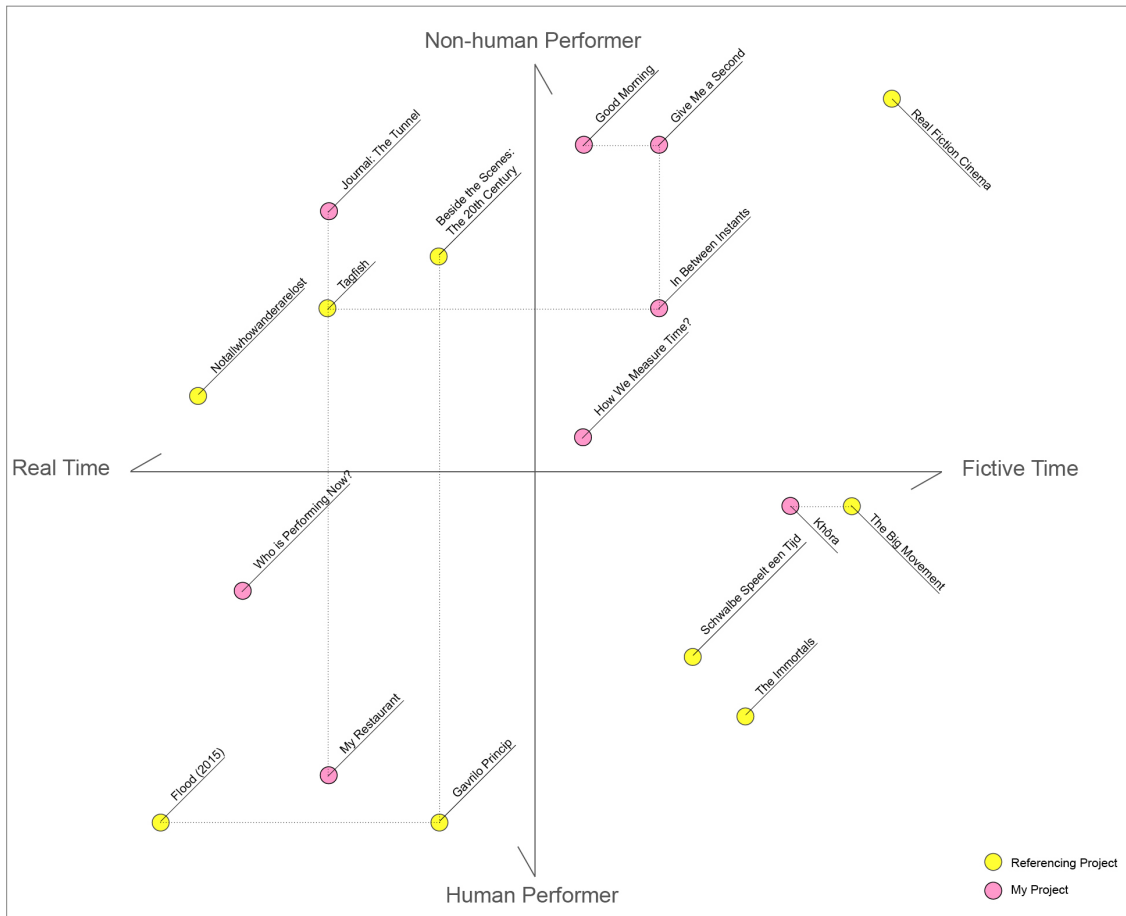

Diagram 5. 17 Projects in the quadrant

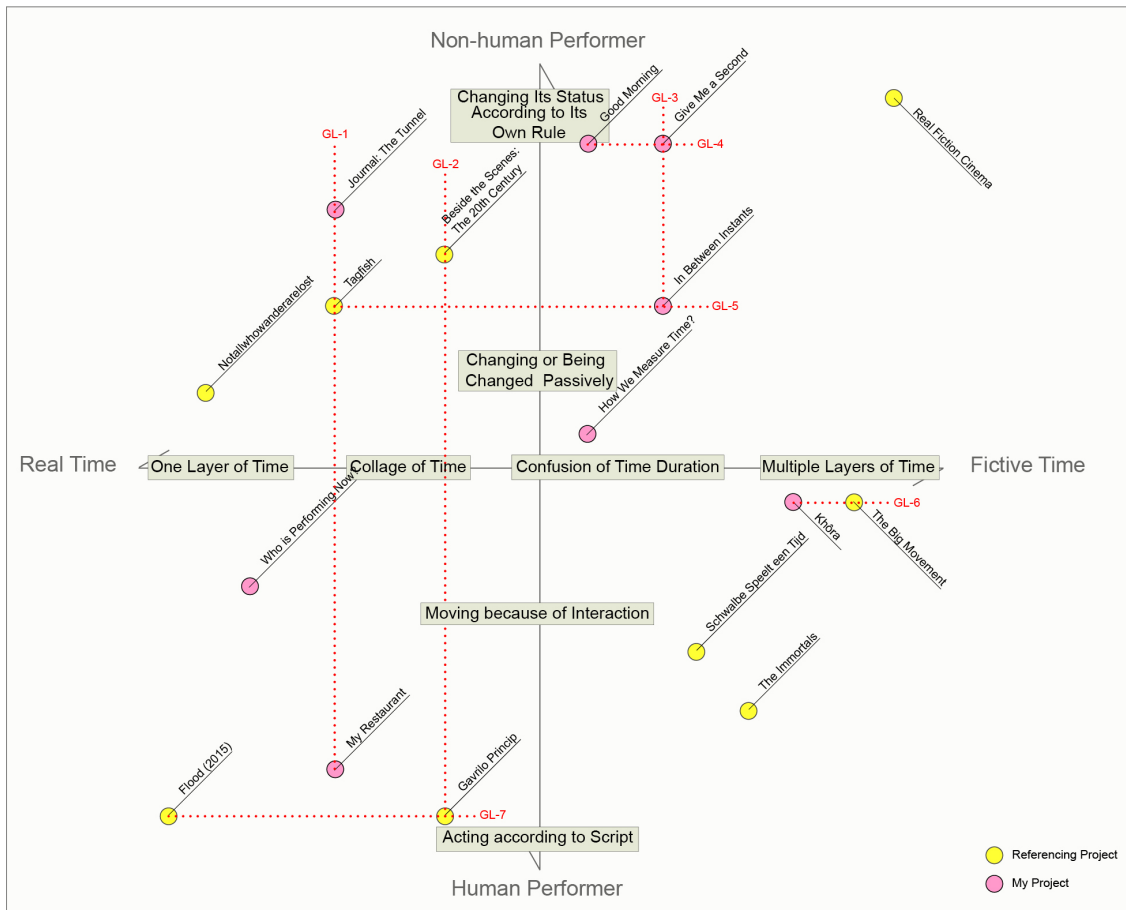

Diagram 6. Works in the quadrant and relations with transitions

## The Quadrant and the analysis of works 2.

Reference Works On Quadrant 2.5

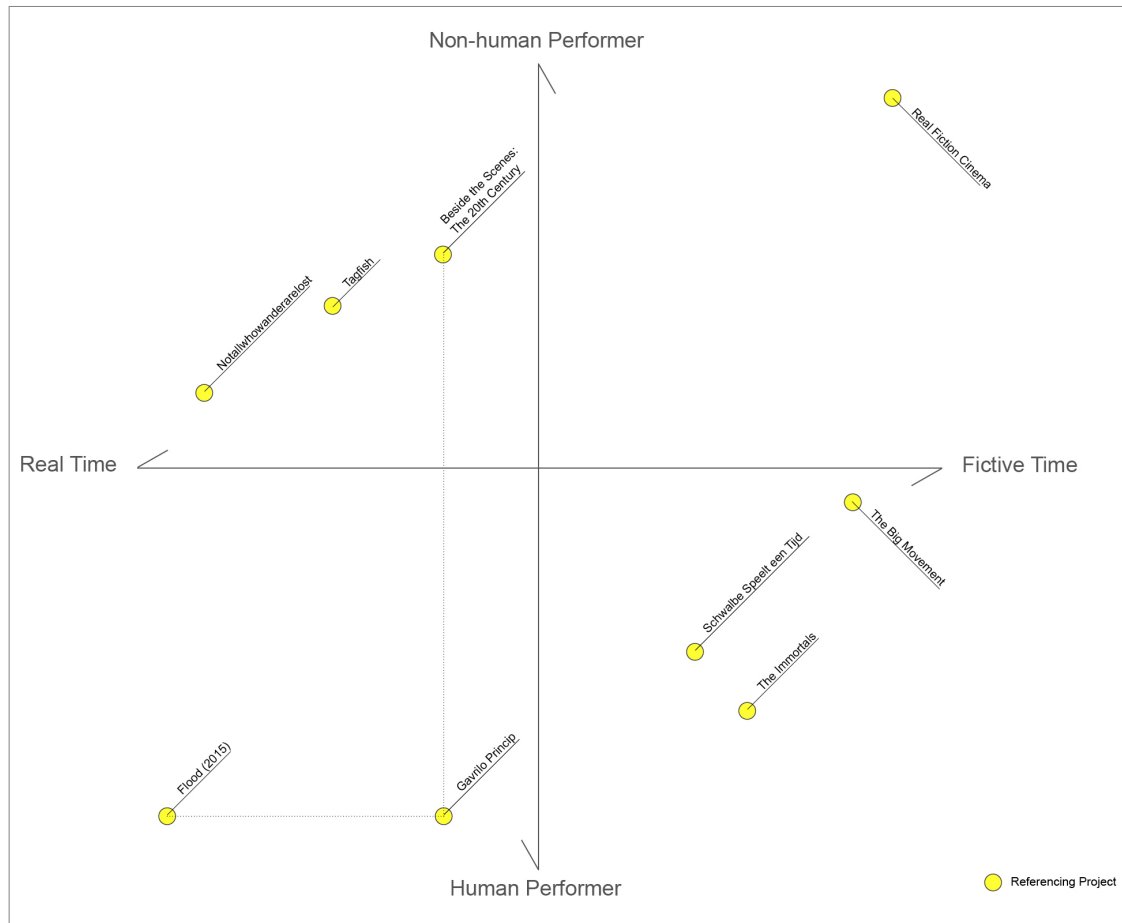

Diagram 7. Reference works on quadrant

## The Quadrant and the analysis of works 2.

My Own Works On Quadrant 2.6

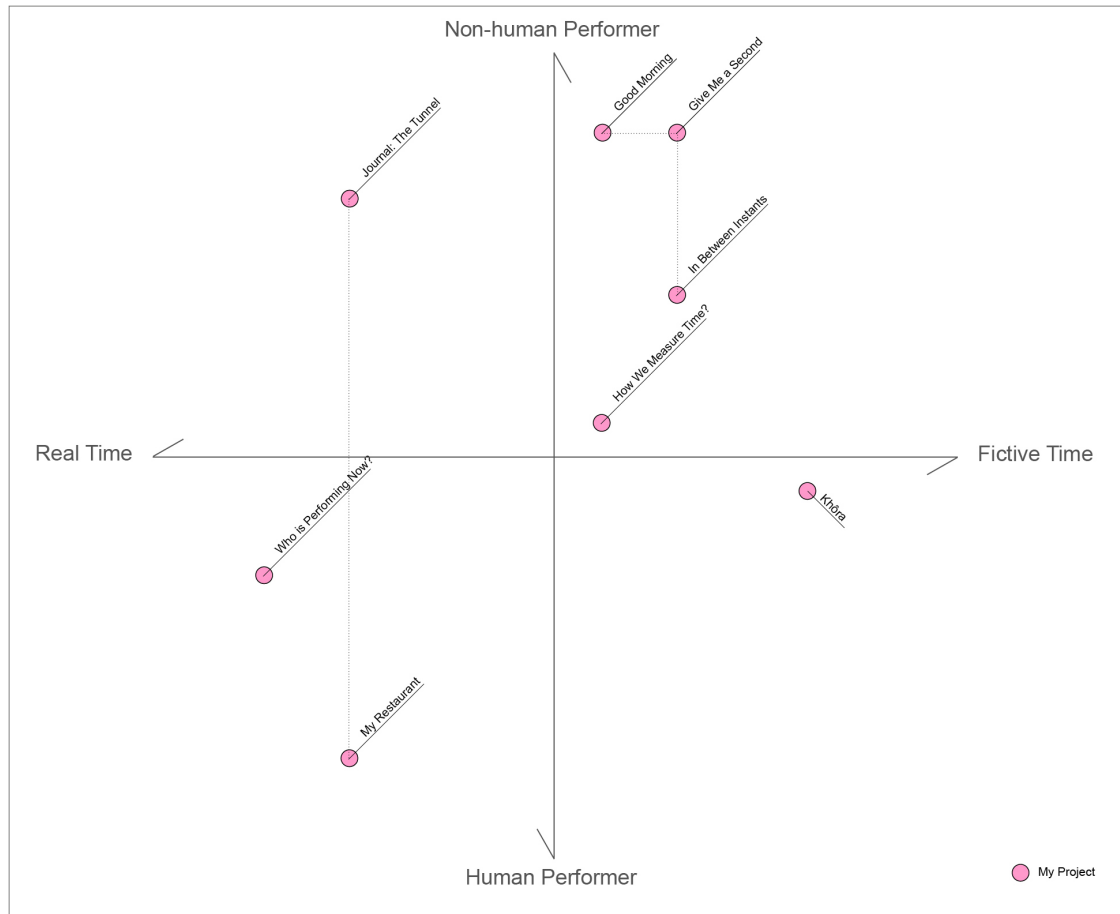

Diagram 8. My own works on quadrant

## The Quadrant and the analysis of works 2.

### Guide Lines 2.7

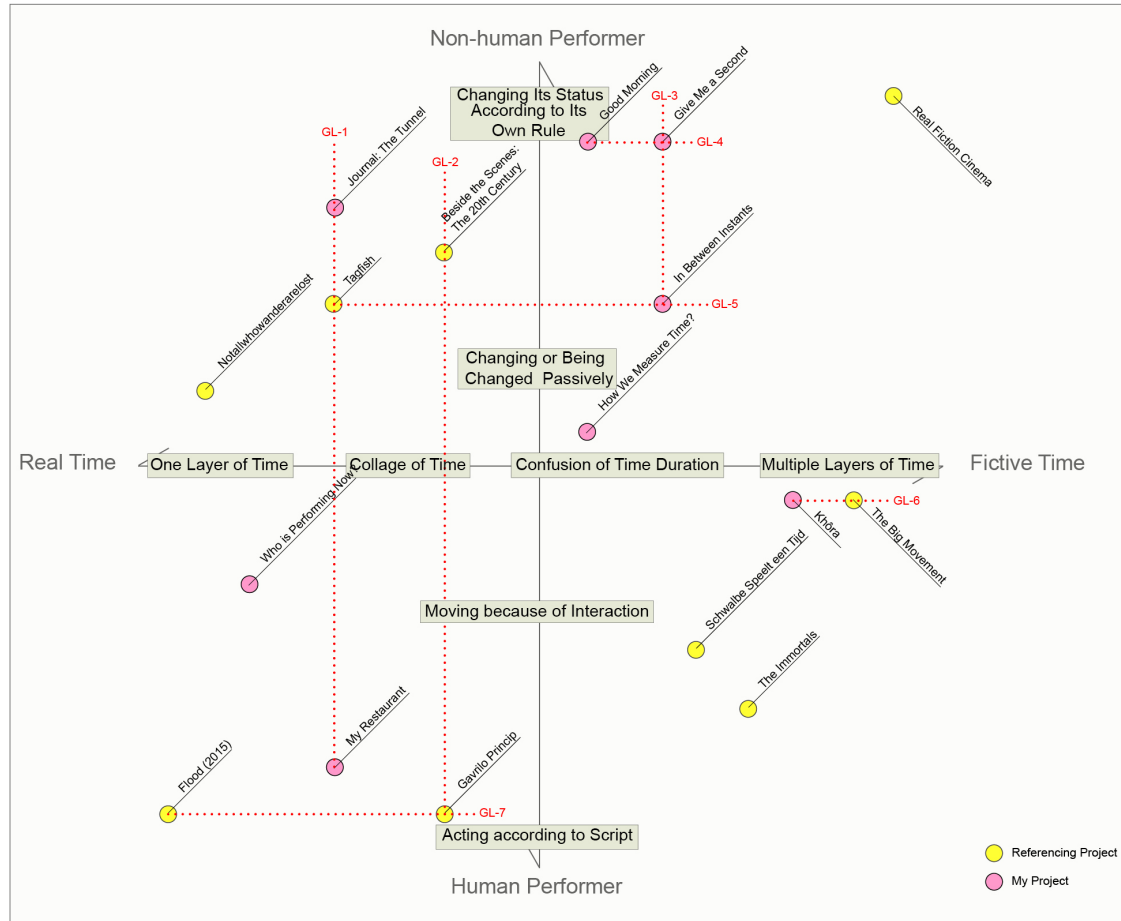

Diagram 9. Guide Lines

The guide lines (GL) are shown after I place all works in the quadrant. The lines indicate the two or more works that have the same “variable” either on the X-axis: Time or on the Y-axis: Performer.

There are three projects that I place on GL-1, which are Tagfish from Berlin, my own works Journal: The Tunnel and My Restaurant. These three works are all related to representation of something happened in the past, by composing the recorded videos, projecting the videos in another environment which is different from the original one or both. It is a way to present the content by recomposing the real, but not current time. My Restaurant, a performative presentation for my semester assessment, involves me as an actor to serve the “food” on a long table for the two guests who are my program tutors. The work Tagfish, [P.5] has a story that happens in a conference room, but there are only two human actors on stage. All the people involved in the meeting are presented by videos of their individual interviews. The whole conversation is presented by a series of well- composed videos. In Journal: The Tunnel, it is a one-minute videos collection from the same site in Utrecht. I captured the things that happened at the site through camera: a sound, a reflection or a water drop. In another space, an old factory in Culemborg, I projected the videos on the glass of a rusted metal door.

On GL-2, two works are placed: Beside the scenes: The 20th Century from Hofmann & Lindholm [P.6] and Gavriló Princip from De Warme Winkel [P.3]. Both works tell their story of the past. The difference is that there are more actors involved in the work Gavriló Princip, while Beside the scenes: The 20th Century is presented mainly through projections.

My two works: Give me a Second and In Between Instants are on GL-3. In both works I use similar ways to create the fictive time experience for spectators. In the former work, I said: 'give me a second' to the spectators when they entered, but actually the real duration was much longer than one second. In In Between Instants, spectators sit there for three minutes, but the voice that is heard during the performance tells them that the time that had just passed was shorter than an instant. The unit of time has been changed here.

GL-4 indicates that in the involved projects the objects change their status according to their own component, structure or irreversible movement.

The way that the work Tagfish and In Between Instants present their stories is through a prerecorded image or voice. There are indeed real humans on the stage, but in both cases, they play a role for supporting the whole performance, not for telling the story. So I place them here, the line GL-5.

The Big Movement from Dries Verhoeven, [P.8] a video work but site specific project and my project Khôra are located on GL-6. Both projects are performed by one human actor, the person who knows what the story are about and what she should do in order to bring the story to an end. But there are many unpredictable elements influencing their movement or the duration.

The actors involved in the two projects on GL-7, Flood(2015) [P.4] and Gavriló Princip, no matter they have a script or not, they all perform a pre-set role in order to present the story.

## The Quadrant and the analysis of works 2.

### About the Space 2.8

Until now I haven't mentioned about the space in the whole research process yet. But undoubtedly, in every performative work, space is a fundamental element. I cannot think of any work that is presented without a/the space. The space here is not only the space on the stage, but it is broader and much more complex. As Professor Radivoje Dinulović wrote "However, we must always keep in mind the fact that the stage-auditorium space is only one of the elements in a complex physical structural system of the theatre." [2] What a spectator experience in a performative work should be a sum of all experiences (s)he has prior to, during and after the performance.

I tried to find a way to discuss about space and of course the discussion should also relate to the analysis and the quadrant that I have developed. I visualize some thoughts about spatial layers in a whole performative experience.

There are four different spaces: public space, theater space, dramatic space and intermediary space. These spaces can form four different spatial types as shown in Diagram 10 to 13:

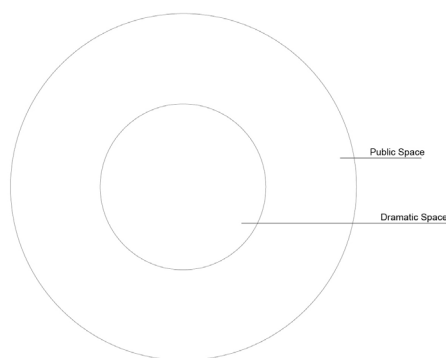

Diagram 10. Two Layers: Public Space & Dramatic Space

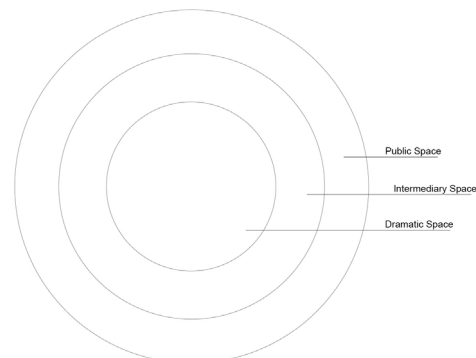

Diagram 11. Three Layers: Public space & Intermediary Space & Dramatic Space

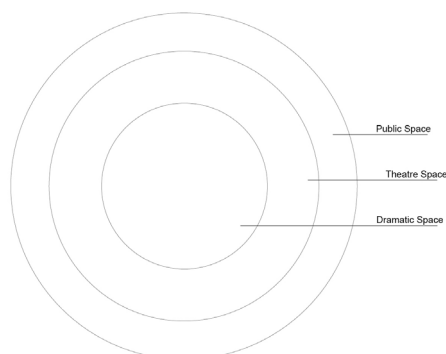

Diagram 12. Three Layers: Public Space & Theater Space & Dramatic Space

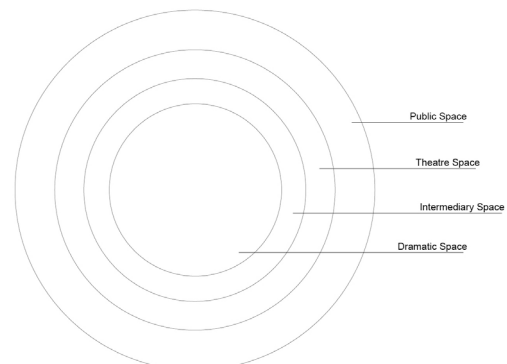

Diagram 13. Four Layers: Public space & Theater Space & Intermediary Space & Dramatic Space

After developing this four diagrams as prototypes, I tried to analyze one project by it and I realized these prototype diagram still need lots of improvements. This is a direction that I would like to continually work further.

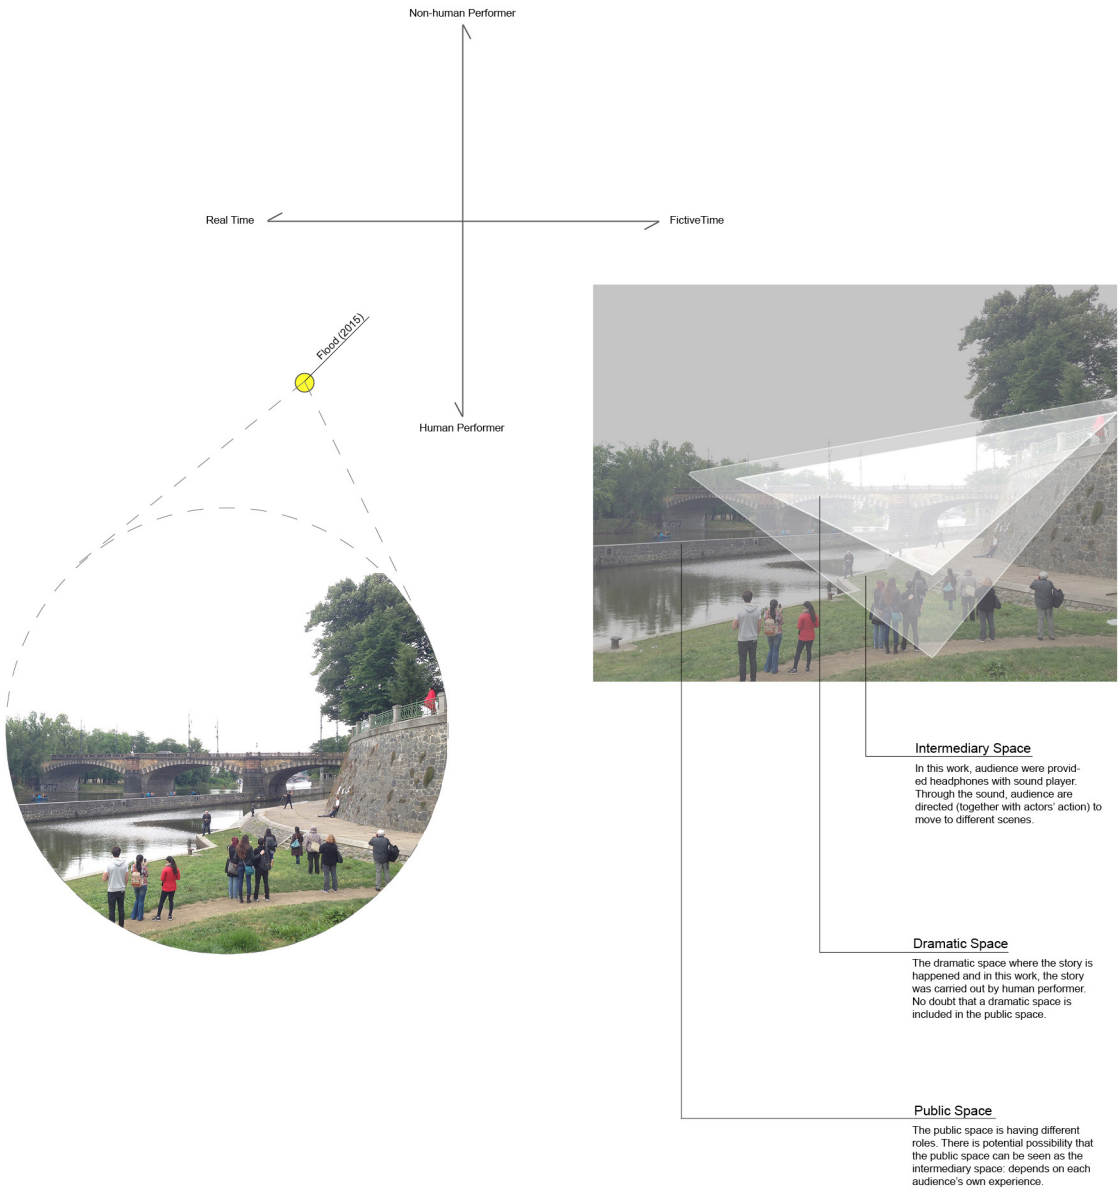

Diagram 14. Analyze One Project by Diagram 13

### Conclusion 3.

When I look back to the whole process (thinking, reading, making and writing) during this two-year-research, I see that I have gone through a developmental process. I feel that I am going towards a direction that I have been longing to go for for a long time. I am excited but also face uncertainty sometimes. Even once in a while, I feel that I might be doing something "wrong". I think that these doubts and uncertainty come from the fact that theatre and performance are not part of my study background, I felt inconfident to discuss about other artists' projects or theatre groups'. Once I mentioned this feeling during a meeting with Nirav Christophe and Falk Hübner. They told me that doing research is a way that you are telling others how you look at things and people so as to start a discussion. Their feedback was very helpful in the sense that I was worried that I might have "the wrong way" to look at others' work, yet now I realize there is actually not one right or wrong way to look at performances. So this research is about understanding more how I make my projects and how I look at other works.

This research centers around the quadrant that I have developed as an analytical tool. I started from a simple prototype diagram (Diagram 1.), and throughout the whole process of analyzing and making process, I have slowly adjusted it, forming the quadrant more precise and more close to how I want it to be (Diagram4).

When I look at the trajectory of my works on the quadrant, it seems that I am moving from Real Time side towards Fictive Time side in the process, on the Y-axis, I am moving more towards the middle which is, as I mentioned in the introduction, because I want to find the transiting point where spectators change their perception of Human Performer - Non-human Performer or Real Time - Fictive Time or vice versa.

In the last part of my research, I started to include space into the research. I am trying to discuss what the influence of space is when the performance happens in different compositions of space. As I have already said in the chapter about the space, I realized that including space in the analysis make this study immensely more complicated to discuss about. But for sure, it will be studied continually in the further research.

I enjoyed the research process a lot, especially the many new insights that I have gained through the inspiring talks with many people and the critical thinking towards my own thoughts. This chapter is indeed a ending for now, yet not a final conclusion of this research. For the next step I want to...

## Acknowledgement

It is a luxury to be back in school as a student and to continue the things that I have set in pause since I graduated from university. Being part of this two-year Scenography program was a great adventure which I enjoyed a lot. For a student like me who is not from a theatre background, I was so inspired by the diversity of performances, workshops, lectures and the experiences. They broadened my views on performance study.

I would like to express my grateful appreciation to many individuals:

Thanks to my two program mentors, Henny Dorr and Tjallien Walma van der Molen, your support, guidance and respect, not only helped me on the development of research, but also, more importantly, gave me lots of strength and confidence.

My program colleagues, Anja Podreka, Dalia Khalife, Hilda Moucharrafiéh, Iro Karara, Katarína Máiková, Maria Vera and the first year colleagues, Astrid Bode, Ana Duarte, Britt van Groningen, Camila Caize, Doro Mines, Fransje Christiaans, Laura de Groot, Nina van der Mark, Samon Presland and Zsofi Hajdu, I have got diverse feedbacks and am inspired by all your individual works during the process.

My external mentor, Masha Ru. Your projects inspired me very much and furthermore your clear feedback helped me to shape the structure of my research document. Your diverse experience make me see the future possibility of continuing making/research with multiple discipline background.

Thesis tutor, Nirav Christophe and project tutors, Vinny Jones and Michiel Voet, all your feedback were a crucial nutrient for the research and most importantly, your positive encouragement supported me to go through some difficulties during the process.

Ministry of Education in Taiwan, I appreciate you granted me a scholarship for studying. Without it, I would have not been so focused on doing research and making projects.

The last, I would like to give special thanks to my dear partner Oscar van den Bosse. You always stand by me and are so enthusiastic on sharing your ideas about the projects. Not only that, you used your knowledge of language and rich experience on editing papers, that helped me greatly on improving the quality of my writing. And my family, parents and sisters, thanks to your support and care I was able to go through the homesickness which I felt more than once.

May 2016 YiLing Hun
